JPR collaborates with golf course managers and greenkeepers to maintain ponds, lakes, and streams on their course. We have recently expanded our capabilities by integrating the Truxor T50 amphibious machines into our plant operations.

The Truxor is designed to tackle wetland vegetation, making it the perfect tool for ponds and lakes. This amphibious vehicle is equipped with a range of attachments, allowing us to effectively remove unwanted plants, weeds, silt, or other debris from your waterbody:

- **Aquatic weed cutting** – streamlining vegetation management and ensuring pristine water features
- **Reed and bulrush control** – maintaining the course's aesthetic and ecological integrity
- **Silt pumping and dredging** – enhancing water quality
- **Lake and pond maintenance** – sustaining the beauty and functionality of these key elements

The Truxor is a light weight and low impact machine which creates minimal disturbance to lawns – vital on golf courses. It is also highly agile and manoeuvrable which means that it can reach inaccessible areas.

Every waterbody is unique, and we take the time to understand your specific needs and customise our solution. Contact us now to discuss your needs.
